

Summary

The University of Trieste installed Senstar Symphony (formerly Aimetis) integrated intelligent video management software using the E3200 Physical Security Appliance to provide a secure and safe environment for the over 23,000 students and 1000 teachers and administrative staff that work, study and reside on the campus.

Business Challenge

Protecting property from vandalism and preventing theft of computer equipment were the main issues that prompted the University of Trieste to find an intelligent video management solution. A proactive solution was required to reduce criminal activity on the campus, which included an effective means to respond to emergency events and review post-event investigation.

The university has a considerable range of individual faculties, spread over a sizeable geographical area within the city of Trieste, which presents its own challenges in security surveillance.

The University of Trieste did have an existing surveillance infrastructure that included analog subsystems individually controlled by a digital recorder. A system was required that would allow using existing analog cameras, and integrating more cameras to the foundation as required while strictly adhering to the budget of the university.

Customer Profile

The University of Trieste is divided into twelve faculties and has a student population of approximately 23,000 students and over 1000 teachers and administrative staff.

Technology

- Senstar E3210 and E3205 Physical Security Devices
- Symphony software licenses, Standard
- AASSET Encoders
- IP GRUNDIG cameras

Solution

After reviewing several different video surveillance options, the Senstar Symphony Intelligent Video Management software and the E3200 Physical Security Appliance were chosen by the University of Trieste for their unique integration of both video management and video analytics into a single platform. The E3200 provides the University with a robust, fanless design which is wall-mountable and ideal for space constrained environments.

The E3200 was installed in 4 buildings and integrated with the existing analog cameras using the AASSET multichannel encoders. The University was pleased with the fact that Symphony provides an open platform that supports a long list of encoders and IP cameras, for easy integration into the current environment and has an intuitive user interface, making it easier for administrative and security personnel to manage.

“We now have a solid, open and scalable solution with Senstar Symphony™, enabling us to deal with the necessary preparation for the current and future security needs of our University while staying within our defined budgets.”

The Department of Technical Services
University of Trieste

The University has utilized several of the analytics options extensively on campus, including video motion detection, object removed, left item detection, people counting and loitering. Plans are in place for Symphony and the E3200 to be deployed on all twelve University faculties over the next three years.

Outcome

- Increased sense of security for students, faculty and visitors
- Overall reduction in vandalism and theft on the University campus
- Simple integration with existing hardware infrastructure
- Easy to use analytics, right out of the box
